PostScript
Processing speed test
version 3.2

Test executed on:
GPL Ghostscript
Running Adobe PostScript
version number 3010

PPST index results

index	Apple LaserWriter	Apple LaserWriter II NTX	QMS PS 2000	This printer
PPST-G	1.0	x.x	x.x	?.?
PPST-R	1.0	x.x	x.x	?.?
PPST-M	1.0	x.x	x.x	?.?
PPST-I	1.0	x.x	x.x	?.?
PPST	1.0	x.x	x.x	?.?

The numbers printed represent a relative index to the first widely used PostScript printer, the Apple LaserWriter. If the numbers under the "This Printer" column indicate a 1.0, then your printer is as fast as an Apple LaserWriter. If the bottom number is 5.0, then it is 5 times faster than the Apple LaserWriter. Lastly, if the number is less than one, for example 0.8, then your printer is slower than the Apple LaserWriter. The numbers in each row have this meaning:

PPST-G is for graphics speed, PPST-R is for RAM & cache speed, PPST-M is for mathematics speed, PPST-I is for bitmapped image speed and PPST, the last row, is for the overall speed rating. Note that the overall speed rating is not an average but is based on the time of all the tests added together.

The actual number of seconds of execution for each test is as follows: 0.0000 seconds for PPST-G, 0.0000 seconds for PPST-R, 0.0000 seconds for PPST-M, 0.0000 seconds for PPST-I, and 0.0000 seconds for the entire test, or PPST for short.
